Synthetic golf hits Western Australia with a bang

The first golf course in Western Australia to convert to synthetic golf greens are being installed by Synthetic Turf Products as of Wednesday at Preston Beach Golf Club, a 9 hole course located south of Perth.

Upon completion of this project in three weeks, the redeveloped golf course near Mandurah will provide greens with a true putting surface requiring no water and little maintenance which other courses are sure to follow.

Synthetic Turf Products will convert the existing sand greens to a synthetic surface using a professional and dedicated team whom have a wealth of knowledge using this type of product.

John Hulme, co-founder of Synthetic Turf Products is responsible for the completion of the project, said collaboration between STP and the golf club has been an integral part of the process in reaching a result the golf club are wanting to achieve.

The use of synthetic golf greens by Preston Beach Golf Club, a first for Western Australia, is a solution to water restrictions and other environment considerations.

Synthetic Turf Products, an established WA Company has installed synthetic golf greens across Australia and Internationally for several years, with the majority of greens being installed in private residences.
